

```
git config user.name "Josh Holtz"  
git commit -m "Added in CI/CD with fastlane"  
git commit -m "Does this work?"  
git commit -m "How about now?"  
git commit -m "Uggghhh"  
git commit -m "sfjiowejfiojewfj"  
git commit -m "Please work 🙏"  
git commit -m "Oh... I forgot an env variable"  
git commit -m "It works!!! Removing all my logs"
```

Who is Josh Holtz?

- ***fastlane*** - 2015 to present
 - Core contributor of *fastlane* since early 2015
 - Lead maintainer of *fastlane* since March 2018
- **RokkinCat** - 2011 to present
 - Software consulting agency focused on new product development
- From **Milwaukee** and now **Chicago** (suburbs)

Another thing about me...

I do have a **stutter** 😞

I have a fear of public speaking 😬

The Josh Holtz Approach To CI/CD with *fastlane*

So... what *is* CI/CD?

It is...

- CI ➡ Continuous Integration
 - Running the tests???
- CD ➡ Continuous Delivery
 - Builds can be made???
- CD ➡ Continuous Deployment
 - Push to production???

Why CI/CD?

Time is money, friend.

– Gazlowe, World of Warcraft

Time is money

- CI *probably* faster
- Jobs scale
- Catches test/build errors ASAP
- Do other work while jobs run
- Documented test/build/release process

Josh's CI Goals

- Validating...
 - that things **still** build
 - no **secret hacks** in build process
- No reliance on **me** to make a build
- Deliver **PR specific** builds for testing
- Latest always on **Test Flight** and **Google Play Beta**

**Okay cool, but how?
Where do we start?**

**Make it simple
Build local first**

Simple and local

```
platform :ios do
  lane :staging
    cocoapods
    match
    gym
    aws_s3
  end
end
```

```
platform :android do
  lane :staging
    gradle
    aws_s3
  end
End
```

Environment variables

```
# .env.dev (committed to version control)
FASTLANE_TEAM_NAME=Josh Holtz

GYM_CONFIGURATION=release
GYM_EXPORT_METHOD=ad-hoc
GYM_EXPORT_TEAM_ID=<redacted>
GYM_XCARGS=DEVELOPMENT_TEAM="redacted" CODE_SIGN_IDENTITY="Apple Distribution"

PRODUCE_APP_NAME=Test Ionic
PRODUCE_SKIP_ITC=true
PRODUCE_APP_IDENTIFIER=com.joshholtz.testionic

MATCH_APP_IDENTIFIER=com.joshholtz.testionic
MATCH_TYPE=adhoc
MATCH_GIT_BRANCH=master

IONIC_BUILD_CONFIGURATION=

S3_BUCKET_APP_DIRECTORY=testionic/dev
```

Links to PR specific builds

1. Build binary with gym or gradle
2. Get PR number from env with ci_pr_number
3. Generate S3 bucket path - ex: "dev/ios/pr/404"
4. Upload to S3 with aws_s3
5. Post comment with link to GitHub with comment_on_pr

**But this should also work without a PR
when run locally** 

fastlane iOS

```
lane :staging
cocoapods
match
gym

path = [ENV['S3_BUCKET_APP_DIRECTORY'], 'ios']
path += ['pr', ci_pr_number] if ci_pr_number
path << 'latest' unless ci_pr_number

aws_s3(app_directory: File.join(path))

url = Actions.lane_context[SharedValues::S3_HTML_OUTPUT_PATH]
comment_on_pr(body: "Download iOS app at #{url}")
end
```

fastlane Android

```
lane :staging
gradle

path = [ENV['S3_BUCKET_APP_DIRECTORY'], 'android']
path += ['pr', ci_pr_number] if ci_pr_number
path << 'latest' unless ci_pr_number

aws_s3(app_directory: File.join(path))

url = Actions.lane_context[SharedValues::S3_HTML_OUTPUT_PATH]
comment_on_pr(body: "Download Android app at #{url}")
end
```

Run on local

```
$ bundle exec fastlane ios staging --env dev
```

```
$ bundle exec fastlane android staging --env dev
```

Run on CI

```
jobs:  
  build-ios:  
    macos:  
      xcode: '11.2.1'  
    steps:  
      - checkout  
      - run: echo "ruby-2.4.5" > ~/.ruby-version  
      - run: sudo gem install bundler  
      - run: bundle install  
      - run: bundle exec fastlane ios staging --env dev
```

Tada

Pr 1 #1

Add an Environment Variable

[X](#)

To disable string substitution you need to escape the `$` characters by prefixing them with `\`. For example, a value like `usd$` would be entered as `usd\$`.
